

Is Time Bank compatible with Mac?

Last Modified on 04/23/2019 3:52 pm EDT

Time Bank is designed to be run in a Windows environment. The primary reason is that while the Time Bank Online application is web-based, exchanging files to/from a client's local environment requires our local utility [TBXfer](#) . Unfortunately Apple/Mac does not support a similar directory structure and file access available in Windows for [TBXfer](#) to read/write data files.

We find that the great majority of our clients use PCs, and most organizations who do have Macs also have PCs in their environment to run other business applications. If you only have Macs, we have had clients who purchase a low cost PC/Laptop to run Time Bank as our application [does not require a large processor or memory](#).

Please stay tuned as we will be evaluating Mac compatibility in the future based on client demand.
